CSCI 104L Lecture 2: Streams and Recursion

Example usage of file streams; you’ll need to include \texttt{fstream}.

```cpp
ofstream myFile;
myFile.open(”games.txt”);
myFile << ”1: Minecraft” << endl;
myFile.close();
ifstream myFile2;
string line;
myFile2.open(”games.txt”);
getline(myFile2, line);
cout << line;
myFile2.close();
```

Example usage of string streams; you’ll need to include \texttt{sstream}

```cpp
int first;
string second;
char third;
string fourth;
stringstream ss;
ss << ”1: Minecraft”;
ss >> first;
ss >> second;
ss >> third;
ss >> fourth;
cout << first << endl << second << endl << third << endl << fourth;
```

\textbf{Recursive} means “defined in terms of itself”.

```cpp
int iterativeFactorial(int n) {
    int p=1;
    for (int i=1; i <= n; i++)
        p *= i;
    return p;
}
```

```cpp
int recursiveFactorial(int n) {
    if (n==1) return 1;
    else return n*recursiveFactorial(n-1);
}
```

What will happen if you run the following function?

```cpp
int UCLAfactorial(int n) {
    if (n==1) return 1;
    else return UCLAfactorial(n);
}
```

What will happen if you run the following function?

```cpp
int BruinFactorial(int n) {
    return n*BruinFactorial(n-1);
}
```

Recursive Definitions

You can define other things recursively, not just functions.

- A string of lower-case letters is either: (1) the empty string, or (2) a letter ‘a’-‘z’ followed by a string of lower-case letters.

- A non-negative integer is either: (1) the number 0, or (2) \( n+1 \), where \( n \) is a non-negative integer.

- A palindrome is either: (1) the empty string, or (2) a single letter ‘a’-‘z’, or (3) a string \( xP\), where \( x \) is a single letter ‘a’-‘z’ and \( P \) is a palindrome.

- A simple algebraic expression is either:
  1. A number.
  2. A variable.
  3. (A+B), where A and B are simple algebraic expressions.
  4. (A*B), where A and B are simple algebraic expressions.
